DOMAIN: THE N-TERMINAL DOMAIN CARRIES STRUCTURAL DETERMINANTS ESSENTIAL FOR AGONIST AND ANTAGONIST BINDING. TM2 IS THOUGHT T FORM THE INNERT WALL OF THE CHLORIDE CHANNEL THE CYTOPLASMIC FORM THE INNERT WALL OF THE CHLORIDE CHANNEL INACTIVATION KINETICS. AN IMPORTANT DETERMINANT OF CHANNEL INACTIVATION KINETICS. MISCELLANEOUS: THE ALPHA SUBUNIT BINDS STRYCHNINE.

MISCELLANEOUS: THE ALPHA SUBUNIT BINDS STRYCHNINE.

SIMILARITY: BELONGS TO THE LIGAND-GATED IONIC CHANNEL FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SWISS-PROT entry is copyright. Glycine receptor alpha-1 chain precursor (Glycine subunit) (Strychnine binding subunit)
              "A nonsense mutation in the alphal subunit of the inhibitory gly receptor associated with bovine myocionus.";

Mol. Cell. Neurosci. 17:354-363(2001)
-I- FUNCTION: THE GLYCINE RECEPTOR IS A NEUROTRANSMITTER-GATED I CHANNEL. BINDING OF GLYCINE TO ITS RECEPTOR INCREASES THE CH CONDUCTANCE AND THUS PRODUCES HYPERPOLARIZATION (INHIBITION NEURONAL FIRING) (BY SIMILARITY).

MISCELLANEOUS; HIGHLY SENSITIVE TO ACTIVATION BY TAURINE DESP
THE PRESENCE OF A VALINE IN POSITION 135. IN MAMMALS VALINE A
THIS POSITION CAUSES A DRASTIC LOSS OF TAURINE EFFICACY.
SIMILARITY: BELONGS TO THE LIGAND-GATED IONIC CHANNEL FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SUBCELLULAR LOCATION: Integral membrane protein.

                                                                                                                                                                                                                                                                                                                                         present sequence encodes a human ataxia protein. The ataxia protein and polynucleotides are useful for diagnosing and treating disorders related to ataxia. Ataxia gene sequences are useful in gene therapy, and as diagnostic tools or reagents for identifying a characterizing genetic defect involved in the disorders and disease related to ataxia.

This sequence is used in an expression plasmid operably linked to the tac promoter, a ribosome binding sequence, the E. coli outer, membrane protein OmpF signal peptide coding sequence and a sequence coding for the N-terminal extracellular site of either the gamma-aminobutyric acid (GABA) A receptor alpha-subunit or the glycine receptor alpha-subunit. This expression plasmid can be used to transform E. coli to produce an N-terminal extracellular site protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Prepn. of N-terminal extracellular site protein - by culturi E.coli transformed by a plasmid comprising the tac promoter.

The ataxia protein and polynucleotides are useful for diagnosing and treating disorders related to ataxia. Ataxia gene sequences are useful in gene therapy, and as diagnostic tools or reagents for identifying an characterizing genetic defect involved in the disorders and diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 linked to the tac promoter, a ribosome binding sequence, the E. coli outer membrane protein OmpF signal peptide coding sequence and a sequence coding for the N-terminal extracellular site of either the gamma-aminobutyric acid (GABA) A receptor alpha-subunit or the glycine receptor alpha-subunit. This expression plasmid can be used to transform E. coll to produce an N-terminal extracellular site protein of ion channel direct binding type receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 657
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ŏ
